B. ABSTRACT

The subject invention is an improved band aid (bandage covering) for use in treatment of wounds where medication is to be administered to a surface wound, infection, or other problem on the skin of an individual, such band aid comprising, in general, a bandage member or similar member adapted to cover the skin area where the wound is located, such bandage member having a portion thereof with an opening on the upper bandage surface that extends to the lower surface of the bandage and which opening has a removable cover over the upper part thereof with the opening being used to insert medication to reach a specific wound area under the bandage and which opening is then recovered after the medication is so placed.
